

Facts about

IVERMECTIN

Key Points:

- Ivermectin is derived from the avermectin family of pesticides.
- Serious adverse events have been recorded in Sub-Saharan Africa where it was tested <https://journals.plos.org/plosntds/article?id=10.1371/journal.pntd.0009354>
- Ivermectin is toxic for border collie dogs. This is because they have a mutation in the MDR-1 gene. 47% of people have this genetic mutation which enables ivermectin to cross the blood brain barrier. People with the MDR-1 mutation were excluded from trials.
- The danger of ivermectin causing neurological and other problems is increased by taking it with (HCQ) hydroxychloroquine.
- The Bill and Melinda Gates Foundation has funded ivermectin since 2004. The foundation is sponsoring the Ivermectin Roadmap which will use IVM to treat malaria in 2024.
- The accumulation of IVM in animal tissues and the excretion of urine and feces in the environment is a major source of potential toxicity

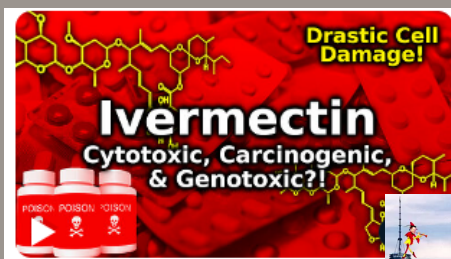

"The ivermectin group was more likely to have bacterial pneumonia complications compared to the control group (43% vs. 23%, $p = 0.02$). Eight patients had a pulmonary embolism or deep vein thrombosis in the ivermectin group, and the ivermectin group more frequently received therapeutic anticoagulation therapy than the control group. In addition, 13 patients had acute kidney injury in the ivermectin group."
<https://pubmed.ncbi.nlm.nih.gov/1692082/>

"A case series of serious neurological adverse events occurring with the use of ivermectin outside of the onchocerciasis indication has been identified in VigiBase, an international database of suspected adverse drug reactions."
